

Vision-hover marker

1.000 in (25.4 mm) solid square

Ruler check: these ticks must sit exactly 1 inch apart.

BEFORE USE - print at 100% / Actual Size. Turn OFF Fit to Page and Shrink to Fit. Then measure the square with a ruler: it must be exactly 1.000 in (25.4 mm) on each edge. A scaled print silently corrupts every distance the drone computes.

Mount flat on a light-coloured wall, square is upright, no tilt. A page that contrasts strongly with the wall behind it can itself read as a large square blob and beat the marker - if the calibration wizard warns the box is huge, that is what happened. Trim the margins or use a lighter backing.
